Frameless Glazing

Frameless glazing systems have come into our market a few years ago as a very expensive and exclusive product. Outside the glazing system for balconies and loggias is a continuous glass wall, without frame and uprights,

Balcony can be fully open, slide the blade of glass to the side and turning them against the wall, where they form a kind of 'Book'. Glass fabric slip on the rollers in upper and lower aluminium rails. In the closed state glazing locked on the lock key. Clearly, the system is very user friendly and outwardly look very impress. but it costs an average of 3 times greater than aluminum counterparts.

The advantages of Frames glazing systems include

- Lack of racks, the ability to skip a lot of light, striking appearance.
- Possibility to move all the doors to the side and unleash the fully opening balconies or terraces.
- Ease of cleaning of the valves opening inwards.
- Able to move the valve not only for the straight guide, but also through any angle, which ensures full opening gazebo, regardless of its configuration.
- Use only safe, tempered glass.

Shower Screen

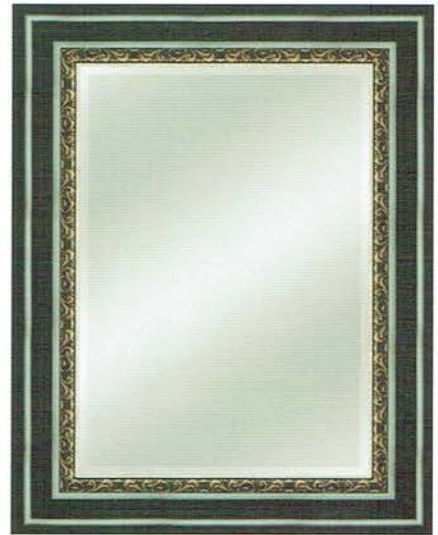

Shower Screen are used in bathrooms that help keep water inside a shower or bathtub and are great alternatives to shower curtains. They are available in many different styles such as framed or frameless, sliding or swing.

They are usually constructed of aluminum, clear glass or tempered glass. Shower doors can come in many different hardware finishes and glass patterns that can match other bathrooms hardware such as faucets and shower heads. There are also shower doors that are in a neo angle design for use on shower pans that have the neo design as well. The design of the shower pan is extremely important as the shower door must be the type required for the pan in order to work.

Mirrors

Vinyl backed mirror can be used provided that adhesive and tape are compatible with vinyl and will not separate. With this type of installation method, the adhesive is used to bond the mirror permanently to the wall. The tape is used to hold the mirror to the wall while the adhesive cures. Double side tape is also used to compensate for any deflection in the mirror. With wet area mirrors, a major objective is to minimize the build up of condensation or moisture which causes corrosion. This is partly achieved by running the tape vertically or at parallel diagonals with the mirror adhesive applied in between, which lessens the build up of moisture and provides a small gap for air circulation.

Partition

We are providing a high quality and contemporary range of office glass partitions, create an office environment designed around you and installed to the highest standards. The challenge of the modern office is how to provide enough privacy, quiet, and a pleasant space conducive with concentration, and yet provide a light aesthetically pleasing space that is very much in touch with the rest of the office. Our glass partition systems combine the best of vision and privacy, and can provide a feeling of space, with aesthetically pleasing focal points.

The clarity and vision of our glass partitions is maintained by the aluminium tracks at the top and the bottom of the 10 or 12 mm toughened glass panels, and the clear or crystal clear silicone sealing.

Balustrades

We do Complete Design, Fabrication of high quality powder coated aluminium, stainless steel and glass balustrades, pool fences, gates, screens, pergolas, spiral staircases and architectural designs for Multi-storey developments, Commercial, refurbishments and private project. All of our balustrades are custom made taking your specific requirements into account. We offer balustrades in 8, 10, 12 or 15 mm thick toughened safety glass for strength, durability and greater flexibility in design.

Etched Glass

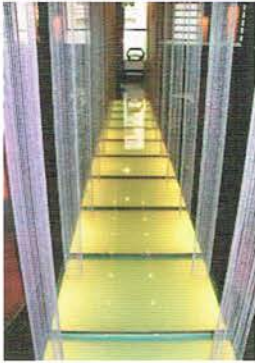

Etching refers to the technique of creating art on the surface of glass by applying acidic, caustic, or abrasive substances. Traditionally this was done after the glass was blown or cast.

Sandblasting is used for creating patterns in glassware, creating a "Frosted" look to the glass. High pressure air mixed with an abrasive material cuts away at the glass surface to create the effect. The longer the stream of air and abrasive material are focused in one spot, the deeper the cut will be. Sandblasting is often used for removing unwanted items that have stuck to the glass or as a decorative purpose on gifted and personal items.

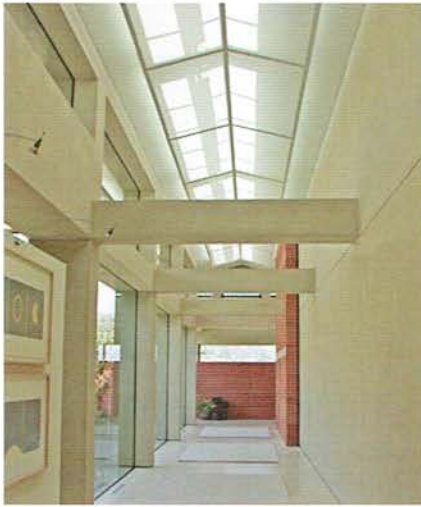

Glass Flooring

Glass Flooring as glass stairs, is usually constructed of 2 or more glass panels, laminated together. Approximately 1m² is usually considered to be a practical maximum area for each panel - due to handling considerations. The glasses should be installed with the thicker glass ply uppermost, and consideration must be given to the surface finish of the glass.

Skylight

Skylights are not only functional day-lighting products, but an architectural design feature with a number of benefits. The installation of a Skylight adds fresh air, light and sky views, transforming the quality of both home and working environments. Skylights provide the most effective route to natural daylight. They can also be a source of ventilation or even access to a roof terrace. In order to gain maximum comfort and levels of energy efficiency, the ingress of daylight must be controlled in accordance with the season's climatic conditions. This will achieve the optimum balance of light and heat transfer. The best way to ensure maximum daylight, whilst controlling condensation, solar heat gain and internal heat loss is to employ double glazing with a low emissive coating. The double glazed unit is comprised of two glass sealed together, incorporating an air gap between the two.

Spider System

Spider fittings frameless glass curtain walls connects glass together in an open space using various types of light steel structures via various types of spider fitting members to form flexible and unobstructed curtain wall facade. In this way, fully spider fitted glass curtain walls not only maintain the safety of aluminium alloy frame glass curtain wall but also eliminate the disadvantages of the later in singular structure and restrictions from construction structures. As a result they are unobstructed as a whole, neat, bright and integrated with such advantages as safety, practicality and artistic taste thus becoming a vogue for modern construction and decorations.

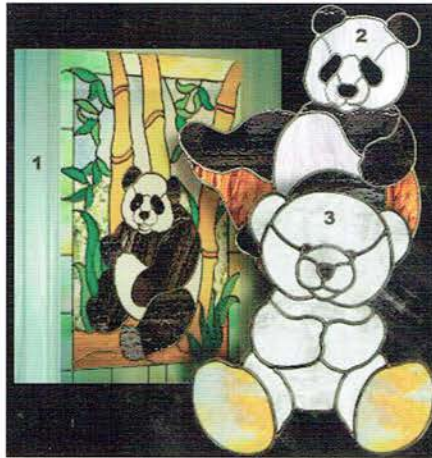

The unique feature of spider fitting glass system lies in its flexibility, forming a structure that enables glass to bend under wind pressure. When glass has equal thickness, this installation method helps to install larger area of glass curtain walls than rigid connection.

Advantages of Spider Glass :

- Large and fully smooth glazed area.
- Doors and windows can be inserted in a spider glass facade.
- Excellent adaptation to local requirements.
- Fully daylight on all sides.
- Double and single glazing.
- Good thermal insulation with 17 mm airspace in double glazing.
- A solution to more and more structural needs.

Stained Glass

As a material stained glass is glass that has been colored by adding metallic salts during its manufacturing. The colored glass is crafted into stained glass windows in which small pieces of glass are arranged to form patterns or pictures, held together by strips of lead and supported by a rigid frame. Painted details and yellow stain are often used to enhance the design. The term stained glass is also applied to windows in which the colors have been painted on to the glass and then fused to the glass in a kiln.

Stainless Steel Work

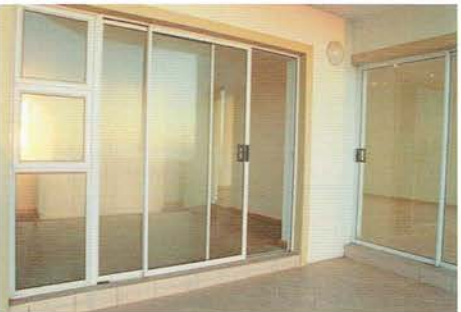

We offer a wide range of stainless steel railing, canopy, that are being largely used in various residential and commercial building. Designed as per the modern market requirement these railings, canopy that we offer are available in different designs and finish. Our Stainless Steel product can also be customer manufactured as per the client's specifications.

Aluminium Doors & Windows

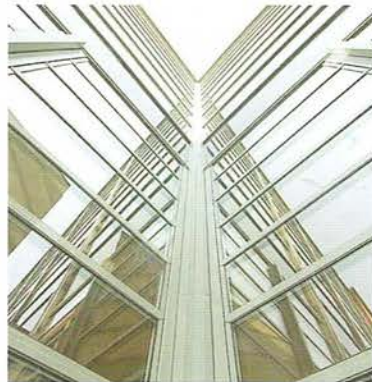

Aluminium doors made up of Aluminium as frame and glass in the center can be used as main entrance door for all types of offices, hotels and for much other purpose as they are very attractive. Aluminium Doors are not so expensive as compared to the traditional wooden doors. Aluminium composite doors are available in sandwich panel.

Aluminium windows offer design flexibility, perfect for new and refurbishment, offices and residential buildings, different opening possibilities. fixed side hung, top hung, tilt turn and pivoting windows. We make a much safer, stronger double hung window with interlocking sash locks and a key alike option.

Curtain Wall

Curtain wall can be formed from a stick system of site assembled framing members, mullions (Vertical) and transoms (Horizontal), Glazing and infill panels are fixed into the framing grid by clamping them in a glazing. Stick curtain walls are usually built from standard systems but they always have nonstandard interfaces with adjacent elements (roof, structure, other wall elements)

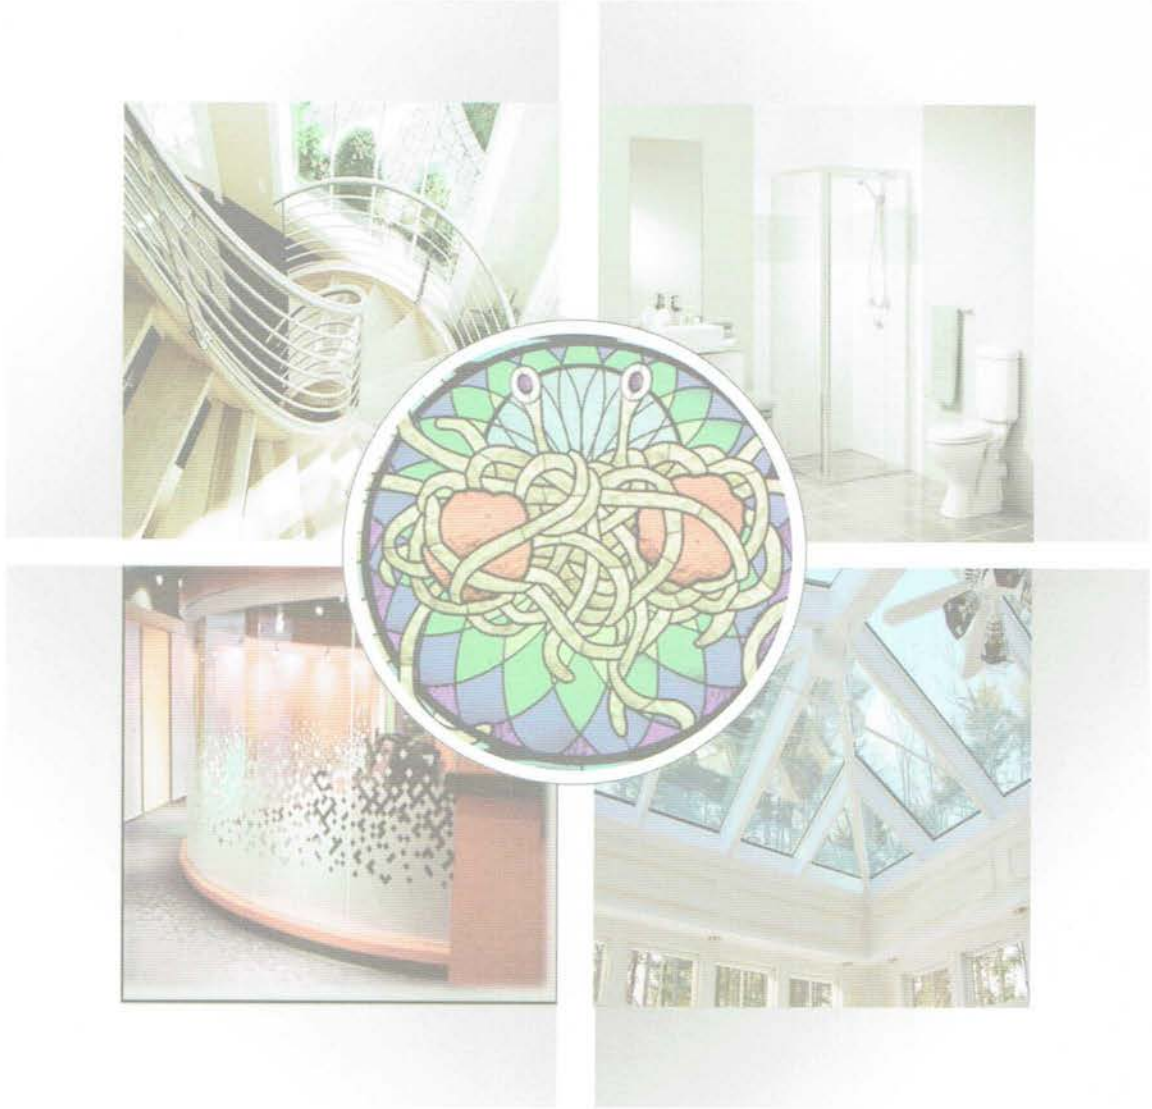

Cladding

Aluminium composite cladding system is basically a typical metal curtain wall system. This system is constructed of light weight aluminium composite panels. Its applications includes exterior cladding, column covers, in-fill panels, fascias and canopies, clean room, interior wall and partition panel, equipment enclosures and beam wraps, trim and accents, parapets, louvers and sun shades cornices.
